Acknowledgement

In the name of ALLAH, Most Beneficent, Most Merciful.

First, I thank Allah at the completion of my project, as I completed this task only by His favor and grace. At this moment, this is due on me, to thank some personalities, because without their cooperation and supervision, I was unable to complete this work.

Secondly, my respected teacher and supervisor, Dr. Ghazanfar Farooq, whose door of kindness always remains open for me. His advices and instructions will guide me throughout my life. Completion of my task would not be possible without his help, encouragement, dynamic supervision and constructive criticism. I am highly indebted expressing my gratitude to him for his entire collaboration. Special thanks to Dr. M. Afzal Bhatti, Dr. Onaiza Maqbool, Dr. Rabeeh Ayaz Abbasi, Dr. Mubashir Mushtaq, Miss Ifrah Farrukh Khan, Madam Memoona Afsheen Malik, Dr. Mudassir Azam Sindhu, Dr. Shuaib Karim, Dr. Khalid Saleem, Dr. Muhammad Usman, Dr. Muhammad Naqi, Dr. Umer Rasheed and Dr. Muhammad Imran for their kind support and cooperation.

It is also necessary to me, to thank my parents whose prayers are treasure of my life. I have no words to pay gratitude to them whose affection, guidance and continuous encouragement did their best to shape my character.

Hamza Ahmad

2014-2018

Abstract

Student project tracking is done by a teacher. This is done by giving the students tasks and to review the outcome of tasks in meetings with the students. Teacher cannot handle student's record manually. When there are several students under his/her supervision. It is difficult to keep in touch with students and their projects manually. Sometimes teacher forgets which assignment he/she has given to student. What deadline is to be given for completing assignment? Manual tracking of projects is not easy. "Student Project Tracking" is an online web-based system. It will keep track of records related to project assignments/tasks of student. The system has three user roles - Student, Teacher and Project Coordinator (Project Coordinator is a teacher). Teacher can easily communicate with student. Teacher assigns students' assignments pertaining to project. Teacher can check the current assignment given to student and can keep the record of previous assignments. Student can view assignment given to him and can submit completed assignment. Project coordinator verifies tasks like student project allocation and add announcements to the system. This system is only for the students and teachers. It is assumed that Students and teachers will get sign in from their CMS (Campus Management System) ID's. We are developing this application in Notepad++ using HTML, JavaScript, PHP language and MySQL.

CHAPTER 1

Introduction

CHAPTER 1 Introduction

This report first introduces student project tracking. It then highlights the problem that has been addressed in this work along with the designed and developed solution. Chapter 1 elaborates project organization and project planning. Finally, the chapter elucidates the scope and objectives of this project.

1.1 Problem Definition

Student project tracking is done by a teacher. This is done by giving the students tasks and to review the outcome of tasks in meetings with the students. Teacher cannot handle student's record manually. When there are several students under his/her supervision. It is difficult to keep in touch with students and their projects manually. Sometimes Teacher forgets which assignment he/she has given to student. What deadline is to be given for completing assignment? Manual tracking of projects is not easy.

1.2 Proposed Solution

“Student Project Tracking” is an online web-based system. It will keep track of records related to project assignments/tasks of student. Teacher can easily communicate with student. Teacher assigns students' assignments preparing to project. Teacher can check the current assignment given to student and can keep the record of previous assignments. Student can view assignment given to him and can submit completed assignment.

1.3 Scope

Scope of the system defines the boundaries of the system that what will the software deliver to users.

1. Project Allocation.
2. Scheduling of Assignment related to project.
3. Evaluation of the Assignments.
4. Adding events like announcements.

1.4 Objectives

The primary objective of the system is to facilitate both teachers and students. This system overcomes the burden of manual works. Student has to come to department for meeting. Sometimes teacher may not be available in department. Keeping records manually is not easy. Records may be misplaced by teacher, so web system is manageable. It would be time-saving and easily manageable.

1.5 Project Organization

Project organization is a structure that facilitates the coordination and implementation of project activities. Its main reason is to create an environment that fosters interactions with a minimum amount of disruptions, overlaps, and conflict. Project organization is basically how the project is organized according to software engineering. Which process model is going to be followed and what are major roles and responsibilities. Finally, which tools and techniques will be used in order to develop this system?

Software Process Model

For this project water fall process model will be followed. The reason for using this process model is that, requirements are well-defined and they are well-understood.

Roles and Responsibilities

The “student’s project tracking” is a individual project, therefore, roles and responsibilities are covered by a individual student.

Tools and Techniques

Tools that are being supported for Analysis, Design and Documentation of this system are notepad++, Microsoft Visio for diagrams such as use case diagram, class diagram, activity diagram, domain model and Entity relationship diagram and for writing documentation Microsoft word is used. For designing project management plan of the system, Project Liber is used.

Student Project Tracking will be developed using PHP, JavaScript, HTML and CSS. HTML will be used to create front end of application. CSS will be used as cascading style sheets to style the contents. PHP will be used for server-side programming. For database MySQL will be used.

1.6 Project Management Plan

Software project planning is assignment which is performed before the production of software actually starts. It is there for the software production but involves no concrete activity that has any direction connection with software production; rather it is a set of multiple processes, which facilitate software production.

1.7 Report Structure

Chapter 1 briefly describes the introduction of the system, what are actual problem and proposed solution, its scope, objective, describe the organization of project and project management plan. Chapter 2 describes the requirements of the system and to decide what the system should do and what the system should not do. Briefly describes complete details of functional and non-functional requirements specifications for the system.

CHAPTER 2

Requirement Gathering and Analysis

CHAPTER 2 Requirement Gathering and Analysis

The purpose of this requirement gathering and analysis is to clear the requirements of the system and to decide what the system should do and what the system should not do. To clear the requirements like function and non-functional requirements for the system and understand the major inputs for and outputs from the system.

2.1. Product Overview

“Student Project Tracking” is a system to keep track of project assignments. This system is basically web-based. The teacher can use this system for tracking student project. The teacher will be able to check current assignment and can as well assign new assignments. When teacher assigns new assignment, a notification will be sent to student.

Major Functions

Teacher will sign in from the mobile or web. System will keep teachers user name as an id and keep password for signing. Teacher has authority to update deadline i.e. if student has requested for extension in assignment deadline. If student has submitted assignment after deadline then late submission status will be shown to teacher. Teacher can assign new assignments to his/her student with the start of date and end date of assignment.

2.2. Major Inputs and outputs

Major inputs are given in following:

- Teacher enters password.
- Teacher enters assignment description and gives deadline to it.
- Teacher adds documents links related to assignments completed.

Major outputs are given in following:

- Assignments are assigned successfully to student and notification is sent to student.

2.3. Definitions, Acronyms and Abbreviations

Table 2. 1 Definitions, Acronyms and Abbreviations

Teacher	Supervisor
SPT	Student project tracking

2.4. User Characteristics

Users of this system are Project coordinator, project teacher(supervisor) and students. It is assumed that the user has basic knowledge of computer or laptop and knowledge of web application and mobile. Users must have knowledge of how to use web-based applications and is able to perform certain tasks.

2.5. Constraints

User should have computer or laptop and internet connection to access the system.

2.6. Assumptions and Dependencies

This web-based application depends upon the availability of internet. It is assumed that the users have a computer or laptop to access the system.

2.7. Specific Requirements

Functional Requirements

Functional requirements are the software capabilities that must be present in order for the user to carry out the services provided by the feature, or to execute the use case. Include how the product should respond to anticipated error conditions or invalid inputs. The system is for Department of Computer Science. The system allows teacher to access the system through entering his name and password. The system gives the proper message of any invalid entry. The system allows teacher to manage assignments with there projects. The system enables teacher to make new assignment and system will send email to student of project his new assignment. Main functional requirements are:

- Teacher will add projects with title and description.
- Teacher will assign project to student.
- Project coordinator will approve student with his/her project.
- Project coordinator will add announcements.

- Project coordinator will assign new project coordinator.
- Project coordinator can check previous project coordinators with start and end dates.
- Teacher will assign project assignments to student.
- Teacher will evaluate assignment.
- Students will response against the announcements.
- Student can reply against assignment.
- Student request for deadline.
- Teacher can update/edit extension deadline.
- Email will be sent to student.
- Assignment Deadline Alert will be send to student 1 day before last date.

External Interface Requirement

This section provides a detailed description of all inputs into and outputs from the system. It also gives a description of the hardware, software and communication interfaces and provides basic prototypes of the user interface.

User Interface

Through user interface user will be able to interact with the system. This will be Web-based application for users. User can use this application through internet. User would have unique username and password to access this application.

Software Interfaces

Student project tracking system is web-based system and it will be implemented through PHP; therefore, this system will be run on any operating system. The internet is required to access the system. The system can be accessed through any internet browser that supports html, css, JavaScript or from any mobile.

Communication Protocol

Communication protocols required for this system are; Hypertext transfer protocol [http] for communication over the internet.

2.8. Software System Attributes

Reliability

System should be reliable. There should be no occurrence of the failure. The system should be able to work properly all-time means the extent to which it works as and when needed.

Availability

System should be available to every user at any time. All the teachers and students are able to access the system at any time.

Security

Since this system will be hosted on server, all the user data will be kept on that server. Product should be able to protect privacy of user data. User can only be accessed the system through user own credentials and any other user should not be able to access to the user private data. User can only perform operation under the permission. Some user groups can be configured that they can never have certain permission.

Maintainability

There should be aspect of maintainability for the system. In some cases, maintainability involves a system of continuous improvement learning from the past in order to improve the ability to maintain systems, or improve reliability of systems based on maintenance experience. The application should be easy to extend. The code should be written in a way that it favors implementation of new functions. In order for future functions to be implemented easily to the application.

Portability

This is web based system so main purpose of developing web-based system is to improve the portability of system. To improve portability. System should be lightweight therefore that it can run on a machine with slow internet connection. To make the web application lightweight, simple libraries and tools should be used at developing phase.

Performance

Since this system is going to web based and mobile based responsive application, it does require a powerful server machine with high band internet access. Server machine should have a powerful CPU and high-speed internet access therefore that it can handle multiple users at the same time. As the system just deployed in computer science department of Quaid I Azam university. Not much burden will be on system because system is bounded for computer science department.

2.9. Product Functions

Teacher Log in

Teacher will add his/her user name and password to login to the system.

Project coordinator

Project coordinator will add his/her user name and password to login to the system.

Student login

Student will add his/her user name and password to login to the system.

Add Project

Teacher will add projects.

Assign Project

Teacher will assign project to student.

Add Assignment

Teacher can add assignments.

View Assignment Deadline request

Teacher will view assignment deadline requests.

Add Announcement

Project coordinator will add announcement.

Assign new Project coordinator

Project coordinator will assign new project coordinator.

Approve Projects

Project coordinator will approve projects with student.

Reply Assignment

Student will add completed assignment.

View Assignment

Student can view assignment.

2.10. Use Case Diagram

List of functions mentioned in previous diagram are described in detail as use cases, therefore we can look more precisely that how user can interact with system to perform different functions.

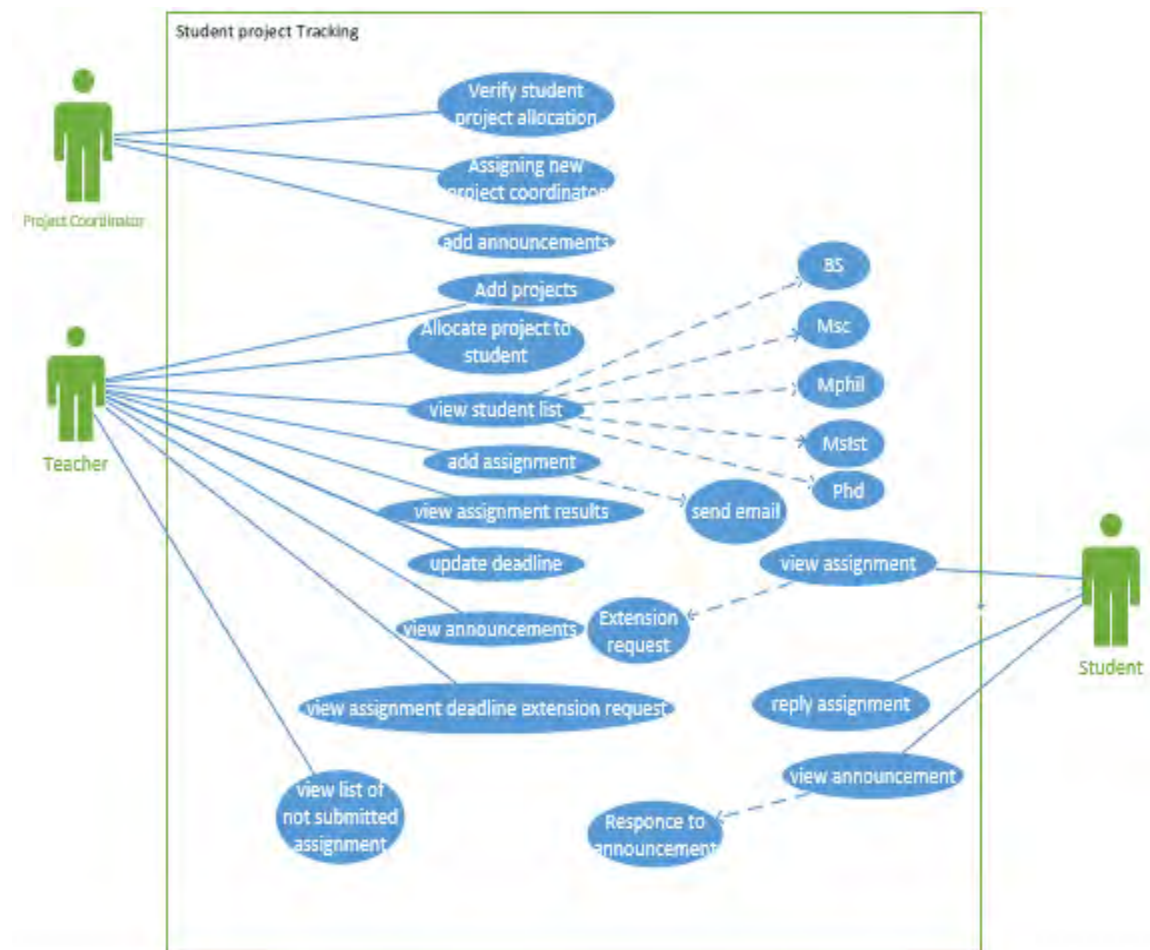

Figure 2. 1 Use case diagram

2.11. Use Case Description

Writing use cases description is an excellent technique to understand and describe requirements. Use cases are a mechanism to help to understand which the system is going to be developed. Informally, they are stories of using a system to meet goals.

Use case 1: login

ID	UC1
Name	Login
Primary Actor	Teacher
Pre-Conditions	User must be from faculty of department
Post-Conditions	User is logged in to the system
Main Success Scenario	<ol style="list-style-type: none"> 1. User enter his/her user name. 2. User enters his/her password 3. User selects login.
Alternative flows or Extensions	<ol style="list-style-type: none"> 1. If User selects login without inserting user name or password, a message will be displayed that, this field is required. 2. If User enters wrong user name or password, a message will be displayed that, please check your username or password.
Frequency	Could be nearly continuous

Table 2. 2 Login description

Use case 2: Add Project

ID	UC2
Name	Add Project
Primary Actor	Teacher
Pre-Conditions	Teacher is logged in
Post-Conditions	Project is added by the teacher
Main Scenario	<p>Success</p> <ol style="list-style-type: none"> 1. Teacher is logged in. 2. Teacher has added Project.
Alternative flows or Extensions	None.
Frequency	Could be one time.

Table 2. 3 Add Project description

Use case 3: Verifying student project allocation

ID	UC3
Name	Verifying student project allocation
Primary Actor	Project coordinator
Pre-Conditions	Project coordinator is logged in
Post-Conditions	Project with student is approved.

Main Scenario	Success 1. Project coordinator is logged in. 2. Project coordinator has approved project with student.
Alternative flows or Extensions	None
Frequency	Could be more than one time.

Table 2. 4 Verifying Student project allocation description

Use case 4: View Student list

ID	UC4
Name	View student list
Primary Actor	Teacher
Pre-Conditions	Teacher is logged in
Post-Conditions	Teacher has viewed student list.
Main Scenario	Success 1. Teacher is logged in. 2. Teacher has viewed student list.
Alternative flows or Extensions	1. There is no student in a list.
Frequency	Could be more than one time

Table 2. 5 View Student list description

Use case 5: Add Assignment

ID	UC5
Name	Add Assignment
Primary Actor	Teacher
Pre-Conditions	Teacher has student with project
Post-Conditions	Assignment is added successfully by teacher.

2.12 Summary

Chapter 2 briefly describes the requirements of the system and to decide what the system should do and what the system should not do. Briefly described complete details of functional and non-functional requirements specifications for the system.

Chapter 3 gives the complete description of software design. It then elaborates the architectural design and detailed description of components of system.

CHAPTER 3

Software Design Description

CHAPTER 03 Software Design Description

This chapter first gives the complete description of software design. It then elaborates the architectural design and detailed description of components of system. Finally, this chapter elucidates the user interface design and interaction diagrams mainly system sequence diagram and class diagram.

3.1 Introduction

Software Design Description (SDD) is the representation of a software design to be used for communication design information to its stakeholders. It shows how the software system will be structured to satisfy the requirements. The SDD is performed in two stages. The first is a preliminary design in which the overall system architecture and data architecture is defined. In the second stage, that is the detailed design stage, more detailed data structures are defined and algorithms and codes are developed for the defined architecture.

Design Overview

Design is meaningful engineering representation of something that is to be built. The design mainly focus on four major areas of concern mainly data, architecture, interfaces and components [3]. Software design is an iterative process through which requirements are translated into a blueprint for constructing the software. It shows how end user can interact with the system therefore mainly focus on user interface design. Design begins with requirement model and at each stage, software design work product are reviewed for clarity, correctness, completeness and consistency with the requirements and with one another. Software design sits at the technical kernel of software engineering and is applied regardless of the software process model that is used. The requirements translated clearly through designing class diagram, sequence diagram, system sequence diagram and user interface interactions.

Requirement Traceability Matrix

Requirements traceability matrix is a matrix in which we describe that which requirement is mapping with which sequence diagram, test case, and method of class diagram. The purpose of traceability matrix is that when requirements have to be updated then one can update that requirement using traceability matrix instead of going through the whole document. It is often used with high-level requirements and detailed requirements of the product to the matching parts of

high-level design, detailed design, test plan, and test cases. Traceability matrix of this system is shown below.

Requirement Id	Requirement Name	Test Case	SSD	Interface
UC:1	Login	Yes	Yes	Yes
UC:2	Approve project	No		Yes
UC:3	Assign new project coordinator	No	Yes	Yes
UC:4	Add announcement	Yes	Yes	Yes
UC:5	Add project	Yes	Yes	Yes
UC:6	Assign project to student	No	No	Yes
UC:7	View student list	No	Yes	Yes
UC:8	Add assignment	Yes	No	Yes
UC:9	View assignment results	No	No	Yes
UC:10	Update deadline	No	Yes	No
UC:11	View Announcements	Yes	No	Yes
UC:12	View assignment deadline request	No	No	Yes
UC:13	View assignment	No	No	Yes
UC:13.1	Extension request	No	No	Yes
UC:14	Reply assignment	No	No	Yes
UC:15	View announcement	Yes	No	Yes
UC:15.1	Response to announcement	No	Yes	Yes
UC:16	View list of not submitted assignment	Yes	Yes	Yes

Table 3. 1 Requirement Traceability Matrix

3.2 System Architecture Design

Architectural design is defines the relationship between major structural elements of the software. It defines the design patterns that can be used to achieve the requirements that have been defined for the system. Architecture design entails the manner in which these components interact and the structure of data that are used by the components. Components or modules are generalized to represent major system elements and their interactions.

Chosen system architecture

The chosen architecture for this system is Three Tier Architectural pattern Three-tier architecture is a software architecture pattern in which the user interface (presentation),functional process logic (business rules), computer data storage and data access are developed and maintained as independent modules Interacting between components of system is shown in diagram. The singular quality of a three-tier architecture is the separation of the application logic into a distinct logical middle tier of software. The interface tier is relatively free of application processing; windows or web pages forward assignment requests to the middle tier. The middle tier communicates with the back-end storage layer.[5]

A three-tier architecture separates its tiers from each other based on the complexity of the users and how they use the data present in the database. In database tier, the database resides along with its query processing languages. This tier also have the relations that define the data and their constraints at this level. The middle tier reside the application server and the programs that access the database. For a user, this application tier presents an abstracted view of the database. End-users are unaware of any existence of the database beyond the application. At the other end, the database tier is not aware of any other user beyond the application tier. Hence, the application layer sits in the middle and acts as a mediator between the end-user and the database. In user interface tier end-users operate on this tier and they know nothing about any existence of the database beyond this layer. At this layer, multiple views of the database can be provided by the application. All views are generated by applications that reside in the application tier.

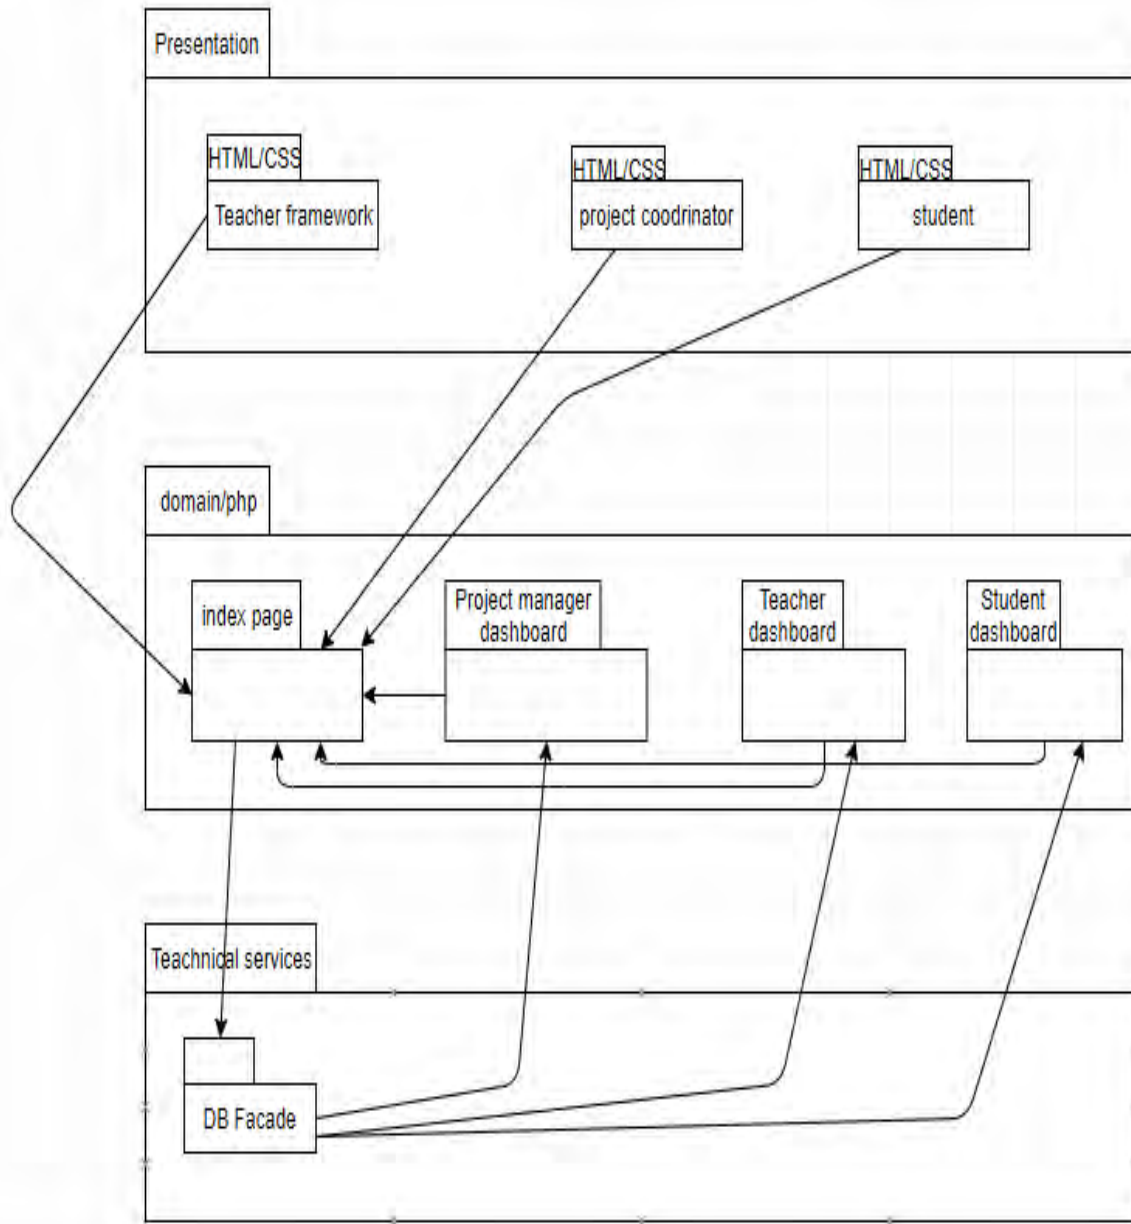

Figure 3. 1 System Architecture Design

3.3 Low-fidelity Interfaces

A **prototype** that is sketchy and incomplete, that has some characteristics of the target product but is otherwise simple, usually in order to quickly produce the **prototype** and test broad concepts.

3.4 System Sequence Diagrams (SSD)

A SSD is a sequence diagram that shows, for a particular scenario of a use case, the events that external actors generate, their order, and possible inter-system events. SSD is visual summaries of the individual use cases.

3.7 Activity diagrams

An activity is a state of doing something. The activity diagram describes the sequencing of activities. Activity diagram depicts the dynamic behavior of a system or part of a system through the flow of control between actions that the system performs. It is similar to a flowchart except that an activity diagram can show concurrent flows. Activity diagrams for this system is given in following:

Teacher (Activity diagram)

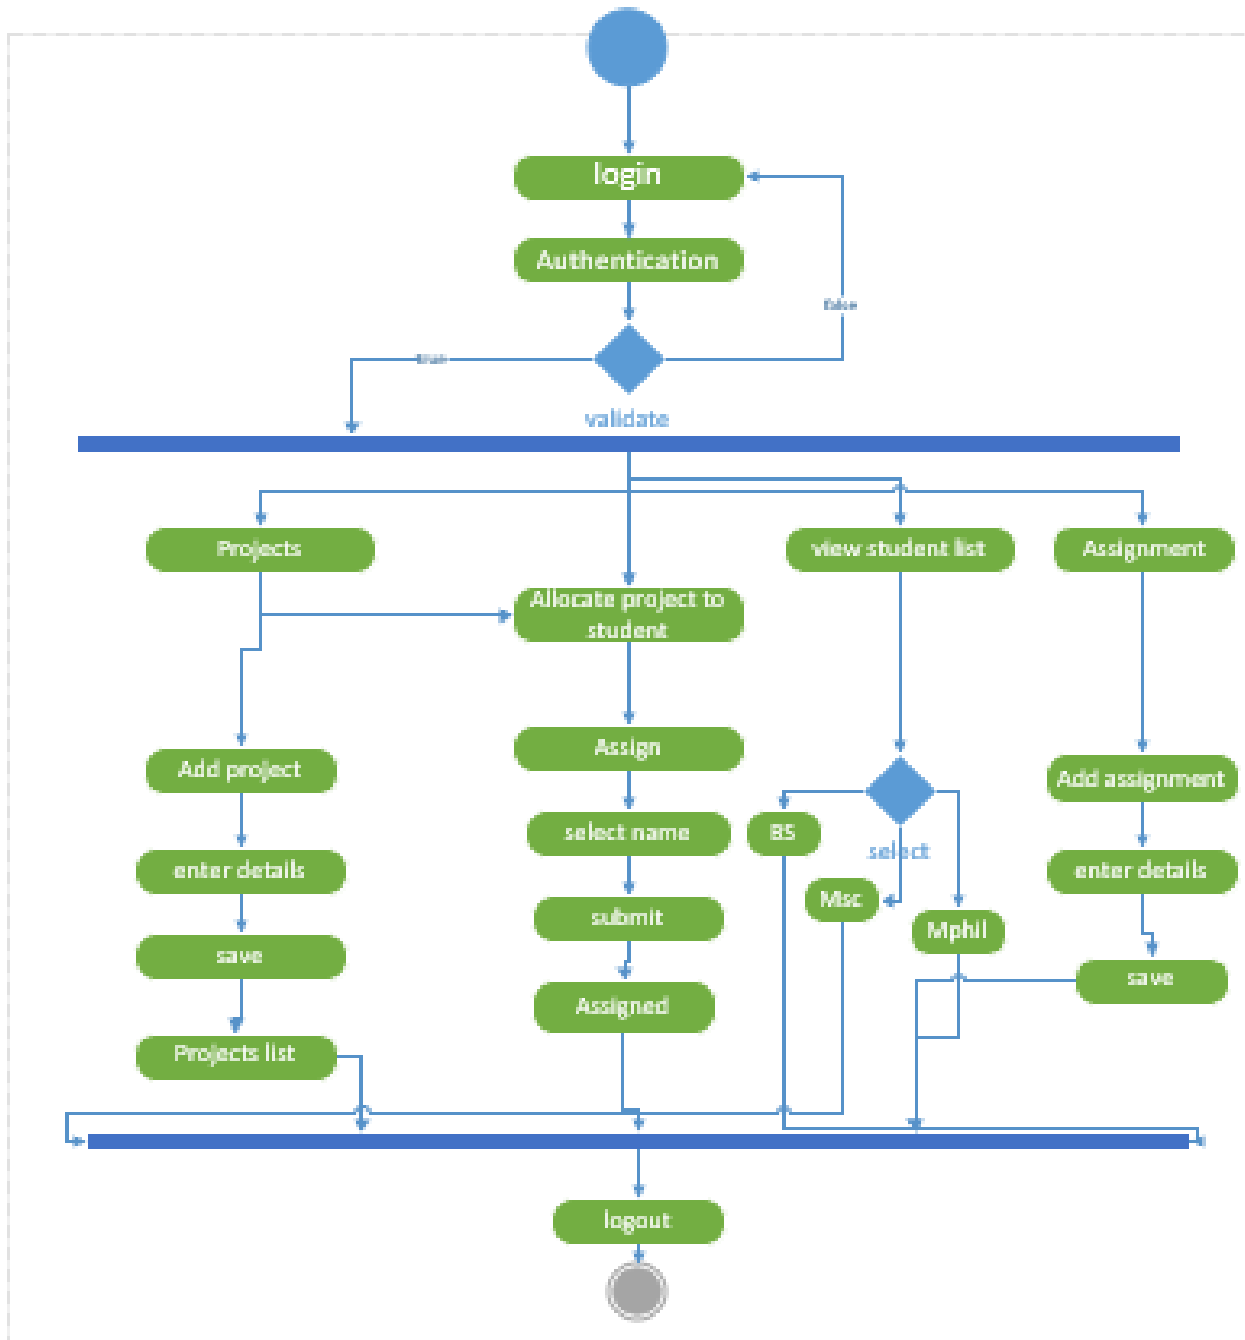

Figure 3. 26 Activity Diagram (Teacher)

Student (Activity diagram)

Figure 3. 27 Activity Diagram (Student)

3.9 Database Design

MySQL database is using for storing all information for the running of web-bases e-cosmetic by Fair cosmetics. There are twelve tables in which information will be stored and retrieved for running of system.

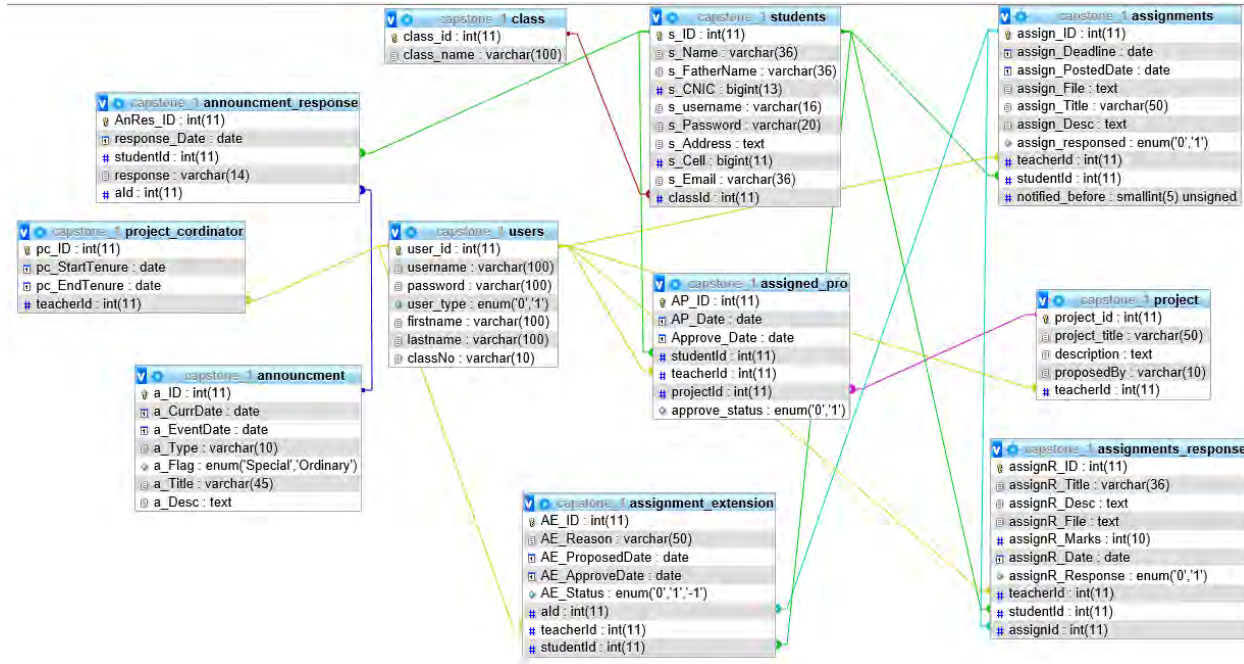

Figure 3. 28 database design

3.9 Summary

Chapter 3 briefly describes the complete description of software design. It then elaborates the architectural design and detailed description of components of system.

Chapter 4 describes the project implementation for “Student Project Tracking” for Department of Computer Science. It has list of tools, language and used in the development of project.

CHAPTER 4

Software Implementation Plan

CHAPTER 4 Software Implementation Plan

This chapter describes the project implementation for “Student Project Tracking” for Department of Computer Science. It has list of tools, language and used in the development of project.

4.1. Language Selection

This project implements in following languages:

- **HTML/CSS/Bootstrap**
Use for designing front-end web pages.
- **Ajax**
Use for the client-side browser to communicate with the server without having to perform a page refresh.
- **JQuery/JavaScript**
Use for scripting and validation.
- **PHP**
Use for server side scripting
- **MySQL**
Use for database.

4.2. Tools Selection

List of tools used for implementation of the project is given below:

- **Notepad++**
Use for writing code for front-end and backend languages.
- **Web browser**
Use for running of OPD web based application.
- **XAMPP Server**
Use for running of database.

4.3 Summary

Chapter 4 briefly describes the project implementation for “Student Project Tracking” for Department of Computer Science. It has list of tools, language and used in the development of project.

Chapter 5 describes software testing and software testing processes. This chapter further elaborates the acceptance test cases which are used to test the functional and non-functional requirements after coding of software.

CHAPTER 5

Software Test Document

CHAPTER 5 Software Test Document

This chapter describes software testing and software testing processes. This chapter further elaborates the acceptance test cases which are used to test the functional and non-functional requirements after coding of software.

5.1 Introduction

Software test document involves the documentation of artefacts that should be developed before or during the testing of software. Software testing is the process of evaluating a system or its component(s) with the intent to find whether it satisfies the specified requirements or not. Testing is executing a system in order to identify any gaps, errors, or missing requirements in contrary to the actual requirements.

Test Approach

Manual testing includes testing a software manually without using any automated tool or any script. The tester takes over the role of an end-user and tests the software to identify any unexpected behaviour or bug. There are different stages for manual testing such as unit testing, system testing, and user acceptance testing. Testers use test plans, test cases, or test scenarios to test a software to ensure the completeness of testing. Manual testing also includes exploratory testing, as testers explore the software to identify errors in it. Unit testing is the process of testing program components, such as methods or object and classes. Individual method or function are simplest type of the component. System testing during development involves integrating components to create a version of the system and then testing the integrated system. System testing checks that components are compatible, interact correctly and transfer the right data at the right time across their interfaces. Test-first development is an approach to development where tests are written before the code to be tested. Small code changes are made and the code is refactored until all tests execute successfully.

5.2 Test Plan

Test planning is an activity that ensures that there is initially a list of assignments and milestones in a baseline plan to track the progress of the project. Test plan determines the scope and the risk that need to be tested and are not to be tested. Deciding fail and pass criteria.

Testing Tools and Environment

A testing environment is a setup of software and hardware on which testing of the newly built product is performed. This setup consists of the physical setup which includes hardware, and logical setup that includes operating system, client operating system, database server, front end running environment, browser (if web application), IIS (version on server side) or any other software components required to run this software product. This testing setup is to be built on both the ends the server and client.

5.3 Test Cases

A test case is a document, which has a set of test data, preconditions, expected results and post conditions, developed for a particular test scenario in order to verify compliance against a specific requirement. Test Case acts as the starting point for the test execution, and after applying a set of input values, the application has a definitive outcome and leaves the system at some end point or also known as execution post condition.

CHAPTER 6

Conclusions and Future Enhancements

CHAPTER 6 Conclusions and Future Enhancements

This document describes the project conclusions and future enhancements i.e. what type of new features can be added with time.

6.1. Conclusions

Project coordinator can make new project coordinator. Project coordinator approves project assigned to any student by teacher. Teacher can assign an assignment to any student. Teacher accept for the extension in deadline of assignment. Student views his assignment and uploads solution. Student requests for extension in deadline.

6.2. Future enhancement

This application is not containing any type of SMS alert. So, it can be made that SMS alert will provide to any student when new assignment added for him.

Appendix

Application Screen Shots

Application screen shots helps to understand the system, its design, input fields and output fields. These screenshots help to understand the application views. These are the screenshots of the application Student Project Tracking.

Allocate Project to Student

The screenshot shows a web form titled "Assign Project". At the top left is a "Back" link with a left-pointing arrow. Below it is a "Select Assign To" dropdown menu with "Select Student" as the selected option. The "Project Title" field contains the text "Data Leak Prevention (DLP) System (Funded by NESCO)". The "Project Description" field contains a detailed paragraph: "Data leak prevention (DLP) is a new area in advanced security arsenal and it provides data-centric security. This solution is based on central policies to identify, monitor and protect data in use, through deep content analysis by applying machine learning (ML) techniques. The DLP system will monitor user activities and when user gives a print or copy/paste command in text documents (*.txt, *.docx), it will apply natural language processing (NLP) techniques and extract content of that document. Client send those content to server and server will apply ML techniques to classify content in secret, confidential and unclassified categories and apply enforcements according to the policy. The developed system should have following features: • should be a distributed client server based application • Client/server should be installable on same or separate machines • Server should be able to respond multiple clients in parallel • Server should be always available in listening mode • Client should be configurable and should start with PC start and automatically connect to Server when computer starts • Every incident of data leak should be logged and reported to administrator Policy creation and enforcement module should be developed". At the bottom center is a green "Submit" button.

Extension Request

The screenshot shows a web form titled "Request for extension". At the top left is a "Back" button. Below it is a red notification bar with an information icon and the text "You have made request for deadline extension.". The form contains several fields: "Deadline" with the value "2019-05-29", "Posted On" with "2019-05-10", "Proposed Date" with "2019-05-30", and "Approved Date" which is empty. The "Status" field is a green button labeled "Approved". The "Reason" field is a text area containing the text "sir i m illl ver muchy".

Reply Assignment

The screenshot shows a web form titled "Submit Assignment". At the top left is a "Back" button. The form has three main sections: "Assignment Title" with a text input field containing "Assignment Title"; "File" with a "Choose file" button, the text "No file chosen", and a red error message "File size should not increase than 8.3 MB"; and "Description" with a large text area containing the placeholder text "Write description here...". At the bottom left of the form is a blue "Save" button with a floppy disk icon.
